Kaushley Mehra

Technical Product Manager — Supply Chain & Optimization Systems

91-9899225890 | kaushley14@gmail.com | LinkedIn

Summary

Technical product manager who owns and **personally builds the decision logic** inside India's largest quick-commerce replenishment system — storage, reverse logistics, and inventory health across **2,500+ dark stores**. Ships the optimization and statistical models directly (Python, SQL, linear programming, empirical Bayes) rather than specifying them. Previously employee #4 at a beverage-commerce startup, building operations, full-stack systems, and a new revenue line from zero.

Professional Experience

Product Manager – Replenishment August 2024 – Present

Blinkit (Eternal Company) *Gurugram, HR*

- Own the **replenishment decision logic** — storage-aware allocation, **reverse stock transfers (RSTOs)**, and inventory health — within the **autonomous replenishment system (ARS)** serving 2,500+ dark stores through a 3.5x scale-up.
- Diagnosed **storage constraints as the largest driver of availability loss** (50–64% of unit drops in peak months; **INR 160–750 Cr/month** GMV at risk); designed an **opportunity-cost–based RSTO cost function** closing the missing feedback loop between storage truncation and reverse-transfer creation — **+72% RSTO share at storage-constrained stores** (18% → 31.6%) and **–26% damage-prone RSTO creation**, from single-warehouse pilot to network rollout.
- Architected and **personally coded the translation layer** between digitized on-ground store layouts and ARS, moving storage truncation from static item-tag rules to live **on-shelf-utilization signals** — eliminating recurring manual inputs and avoiding a severe system rewrite.
- Replaced ad-hoc reverse-transfer clearance with a **tiered, least-aggressive-first escalation framework** triggered strictly on storage conditions and linked to assortment states, festive modes, and throttleable configuration — raising **RSTO automation from ~56% to 90–95%** across **~30x volume growth** (0.4M → 11–13M units/month).
- Designed and coded a city-scale **dead-inventory reclassification engine** (Bengaluru, **3M+ item-outlet pairs**): exposure-adjusted staleness, per-category p80 cutoffs, velocity-based item immunity, and **empirical-Bayes item effects** — replacing blunt legacy dead flags with statistically defensible, category-relative signals.
- Contributed to a **+450 bps store-level availability gain** (p50 74% → 79%) via the allocation-logic and clearance changes, sustained through **~9x peak-demand events** with near-zero manual overrides.

Founding Team Member June 2022 – August 2024

Sip Direct (Ontap Direct Private Limited) *Bangalore, KT*

Beverage commerce platform | 4 cities | 350+ pincodes | 50k+ orders delivered

- Joined as **employee #4**, before product or operational systems existed — set up and optimized the **foundational loops** across operations, technology, finance, and analytics, and stayed the person pulled into urgent, undefined problems.
- Built a net-new **high-margin revenue stream** (Bartending-as-a-Service) from idea to first order — partner onboarding, tech/product implementation, SOPs — eventually contributing **25% of company earnings**.
- Autonomously launched **Siliguri operations end to end in ~60 days** — onboarded retailers, delivery partners, and feet-on-ground, localized the GTM — the company's 2nd operational city, growing to **~20% of company GMV**.
- Worked as a **full-stack developer** on the core engineering team — **React/Node, Apollo GraphQL BFF, Prisma ORM, MySQL** in a microservices stack — wrote the **first line of code in multiple repos**, building internal operations tooling and the consumer app, while interim-running scrums, roadmap, tech debt, and backlog.
- Owned the **data and reporting stack** — schemas, dashboards, and data architecture across **7+ applications** — and ran the platform's **first 3 sales-enablement campaigns** for a major alcobev brand.

Education

Birla Institute of Technology and Science, Pilani July 2018 – June 2023

Bachelor of Engineering in Mechanical Engineering

Master of Science in Chemistry (dual degree)

Skills

Modeling & Data: Python, SQL, Linear Programming (PuLP), Statistical Modeling (Empirical-Bayes Shrinkage), Airflow

Engineering: React, Node.js, Apollo GraphQL, Prisma ORM, MySQL, Microservices

Domain: Demand Forecasting, Inventory Optimization, Reverse Logistics, Storage & Capacity Planning, Dead-Stock Classification, Data Architecture & Reporting
